PRODUCT REQUIREMENTS DOCUMENT (PRD) • DELIVERABLE B

Hospital OP Live Tracker

Complete Technical & Functional Specification Across Modules 1 to 10

PRD Version:	1.0.0 (Engineering Baseline)	**Review Status:**	Baseline Approved
Release Date:	October 24, 2026	**Document Owner:**	Principal PM & Technical Architect
Target Stack:	React 19 + FastAPI + MongoDB	**Target Region:**	Trichy District, Tamil Nadu

Section A: Product Definition & Core Framework

The **Hospital OP Live Tracker** is designed to transform outpatient healthcare operations from chaotic, unpredicted waiting rooms into a synchronized, transparent, and digitally orchestrated flow. Key objectives include:

- **Zero Duplicate Token Guarantee:** Eliminate token collisions using compound database unique constraints under parallel concurrency.
- **No-Show Slot Reclamation:** Automate the transition of absent patients to EXPIRED using an autonomous background worker, advancing queues in real time.
- **Universal Arrival Check-In:** Enable 1-tap patient confirmation at hospital gates, disarming auto-expiry and protecting legitimate arrivals.
- **Doctor OPD Delay Push:** Broadcast real-time procedural delays (+15m/+30m) across waiting screens and patient smartphones with automatic reporting deadline extension.
- **Emergency Bed Visibility:** Provide live, unit-wise occupancy tracking for ICU, Emergency Trauma, and Oxygen beds to streamline critical triage.

A.2 User Personas & Role Permissions Matrix

Role Name	Target Persona	Permitted Actions	System Boundaries & Restrictions
PATIENT	Outpatient / Caregiver	Book token, check in, view queue position, receive SMS, calculate traffic	Read-only queue view; cannot mutate other bookings or see other patient PII
RECEPTIONIST	OP Registration Desk Staff	Issue walk-in tokens, manual patient check-in, search patient bookings	Scoped to assigned hospital; cannot modify doctor clinical actions
NURSE	OP Triage / OPD Floor Nurse	View room queue, manage holding area, verify vitals, call patient	Scoped to assigned department/OPD rooms; cannot alter doctor schedules
DOCTOR	Consulting Specialist	Call next, start visit, complete consultation, mark absent, broadcast OPD delay	Controls active room queue session; cannot modify hospital-wide master settings
HOSPITAL_ADMIN	Medical Superintendent / Ops	Configure departments, doctors, OP schedules, view hospital bed census & analytics	Restricted to single hospital tenant; cannot access competing hospital data
PLATFORM_ADMIN	Regional Authority / SRE	Onboard hospitals, manage global user accounts, view platform health & audit logs	Superuser infrastructure access; clinical record inspection restricted by audit log

A.3 Key End-to-End User Journeys

- **Online Patient Outpatient Flow:** Login via Mobile OTP -> Select hospital & department -> Book token (assigned Token #14, Reporting Deadline 09:40, Grace 09:50) -> Receive SMS & Travel Recommendation -> Arrive at hospital and tap 'Check In' -> Status = CHECKED_IN (immune to auto-expiry) -> Doctor calls Token #14 -> Digital Signage chimes -> Visit starts and completes.
- **Walk-in Outpatient Flow:** Patient arrives at hospital without smartphone -> Receptionist registers walk-in -> System atomically assigns sequential Token #15 with immediate CHECKED_IN status -> Printed slip issued -> Patient waits in lounge watching Waiting Hall TV Mode.
- **Doctor Emergency Delay Broadcast:** Doctor called to emergency angioplasty in Cath Lab -> Taps '+25m' delay on console -> WebSocket pushes DOCTOR_DELAY_UPDATED to all waiting screens and patient phones -> All upcoming reporting deadlines extended by 25 minutes automatically.
- **Autonomous Auto-Expiry of Abandoned Token:** Patient books Token #12 (Reporting Deadline 09:20, Grace 09:30) -> Patient fails to check in -> Server worker detects time > 09:30 and status == 'BOOKED' -> Worker atomically updates Token #12 to EXPIRED -> System advances queue and alerts Token #13.

Section B & C: Complete Functional Scope & Requirements Matrix

Requirements are categorized across 14 areas, establishing measurable acceptance criteria and verified repository status:

Req ID	Requirement Name	Actor	Priority	Acceptance Criteria & Verification	Status
FR-AUTH-001	Mobile OTP Passwordless Gateway	Patient	Must Have	**AC:** Fast2SMS dispatches 6-digit OTP; verifies in <300s; JWT token issued. **Verif:** Pytest test_patient_otp_login_flow	**Verified in Repo**
FR-AUTH-002	Staff Role-Based Authentication	Staff	Must Have	**AC:** Doctor, Receptionist, Admin login with bcrypt hashed password; scoped JWT claims. **Verif:** Pytest security fixtures	**Verified in Repo**
FR-AUTH-003	Auto-Provisioning on First OTP	Patient	Should Have	**AC:** Auto-provisions patient user profile document on first successful OTP verification. **Verif:** Pytest user repository test	**Verified in Repo**
FR-DISC-001	Hospital & Department Search Catalog	Patient	Must Have	**AC:** GET /api/v1/hospitals returns >= 2 hospitals with departments and coordinates. **Verif:** Pytest test_hospital_catalog	**Verified in Repo**
FR-DISC-002	Doctor OPD Schedule Discovery	Patient	Must Have	**AC:** Returns doctor specialization, OPD room, avg consultation min, and token limits. **Verif:** Pytest schedule query test	**Verified in Repo**

FR-BOOK-001	Atomic Online Token Generation	Patient	Must Have	**AC:** Atomically assigns sequential token integer and unique booking_ref with zero collisions. **Verif:** Pytest test_online_and_walkin_booking_flow	**Verified in Repo**
FR-BOOK-002	Reporting Deadline & Grace Assignment	System	Must Have	**AC:** Assigns reporting_deadline and 10-minute grace_period_deadline on token creation. **Verif:** Pytest booking payload validation	**Verified in Repo**
FR-BOOK-003	Self-Service Token Cancellation	Patient	Should Have	**AC:** Patient cancels booked token prior to arrival; freed slot advances upcoming queue. **Verif:** Automated state transition test	Planned (Spec Defined)
FR-QUEUE-001	Single Authoritative Queue per Session	Doctor/Recep	Must Have	**AC:** Single authoritative FIFO queue combining online bookings and walk-ins by token integer. **Verif:** Pytest test_queue_and_token_actions	**Verified in Repo**
FR-QUEUE-002	Walk-in Registration by OP Staff	Receptionist	Must Have	**AC:** Staff registers walk-in; system assigns sequential token with initial CHECKED_IN status. **Verif:** Pytest test_online_and_walkin_booking_flow	**Verified in Repo**
FR-QUEUE-003	Zero-Duplicate Concurrency Guarantee	System	Must Have	**AC:** 30 parallel clients booking simultaneously produce exactly 30 unique token integers. **Verif:** Pytest test_concurrent_booking_zero_duplicates	**Verified in Repo**
FR-EXP-001	1-Tap Patient Arrival Check-In	Patient	Must Have	**AC:** Patient confirms arrival; status = CHECKED_IN; token immune to auto-expiry. **Verif:** Pytest test_checked_in_token_is_immune_to_expiry	**Verified in Repo**
FR-EXP-002	Background Worker Auto-Expiry	Background Worker	Must Have	**AC:** Worker scans every 30s; atomically expires no-shows past grace deadline; advances queue. **Verif:** Pytest background worker scan test	**Verified in Repo**
FR-EXP-003	Crash & Restart Recovery Hook	Startup Lifespan	Must Have	**AC:** Catches up all overdue tokens immediately on server reboot before processing traffic. **Verif:** Automated startup hook test	**Verified in Repo**
FR-STAFF-001	Doctor Room Console Workflow	Doctor	Must Have	**AC:** Action controls (Call, Start Visit, Complete, Hold, Absent); updates in <100ms. **Verif:** Pytest test_queue_and_token_actions	**Verified in Repo**
FR-STAFF-002	Doctor OPD Delay Broadcast Push	Doctor	Must Have	**AC:** Doctor broadcasts +15m/+30m delay; WebSocket pushes notice; extends reporting deadlines. **Verif:** Pytest test_doctor_delay_broadcast_and_reporting_update	**Verified in Repo**
FR-STAFF-003	Patient Absent Marking	Doctor	Must Have	**AC:** Doctor marks absent patient; token expired; queue advances to next waiting patient. **Verif:** Automated absent action test	**Verified in Repo**
FR-HOSP-001	Department & Doctor Catalog CRUD	Hospital Admin	Should Have	**AC:** Admin configures department rooms, active doctors, and schedule session timings. **Verif:** Pytest catalog CRUD test	Partially Implemented
FR-HOSP-002	Operational Grace Period Policy	Hospital Admin	Could Have	**AC:** Admin overrides default 10m grace period per department (e.g. Geriatrics = 20m). **Verif:** Unit policy test	Planned (Spec Defined)
FR-PLAT-001	Multi-Hospital Tenant Onboarding	Platform Admin	Must Have	**AC:** Provisions new hospital tenant; isolates hospital records via hospital_id partition. **Verif:** Tenant isolation test	Planned (Spec Defined)
FR-PLAT-002	Platform-Wide Health Monitoring	Platform Admin	Should Have	**AC:** Returns service status = HEALTHY, database engine, and background worker state. **Verif:** Pytest test_health_check	**Verified in Repo**
FR-BED-001	Emergency Bed Occupancy Tracker	Public/Staff	Must Have	**AC:** Live unit-wise bed numbers (ICU, Trauma, O2, General Ward) with color-coded badges. **Verif:** Pytest test_emergency_beds	**Verified in Repo**
FR-BED-002	Stale Bed Data Warning Indicator	Triage Staff	Should Have	**AC:** Displays amber warning banner if bed census has not been updated within 60 minutes. **Verif:** Frontend delta render test	**Verified in Repo**
FR-WAIT-001	Transparent Heuristic Wait Forecast	Patient/TV	Must Have	**AC:** Computes wait = (Position - 1) * AvgMin + StatusOffset + DoctorDelayMin (±5m margin). **Verif:** Pytest baseline formula test	**Verified in Repo**
FR-WAIT-002	scikit-learn Regression with Fallback	System ML	Should Have	**AC:** Predicts wait using trained regression model; gracefully falls back to heuristic baseline. **Verif:** ML fallback handler unit test	**Verified in Repo**
FR-NOTIF-001	Real-Time WebSocket Push Hub	Clients	Must Have	**AC:** Emits TOKEN_CALLED, TOKEN_EXPIRED, DOCTOR_DELAY_UPDATED in <50ms without polling. **Verif:** Automated WebSocket broadcast test	**Verified in Repo**
FR-NOTIF-002	Multi-Event SMS & In-App Alerts	Patient	Must Have	**AC:** Dispatches SMS for Booking Confirmed, Check-In, Turn Approaching, and Expiry. **Verif:** Pytest test_notifications_dispatch	**Verified in Repo**
FR-VOICE-001	Waiting Hall TV Mode Digital Signage	Waiting Hall	Must Have	**AC:** High-contrast fullscreen display with giant current token, room, and next 3 patients. **Verif:** Frontend visual render test	**Verified in Repo**
FR-VOICE-002	Web Audio Dual-Tone Chime Synth	Waiting Hall	Should Have	**AC:** Synthesizes hospital dual-tone chime (880Hz / 659Hz) on TOKEN_CALLED without MP3 files. **Verif:** Web Audio API initiation test	**Verified in Repo**

FR-TRAF-001	Trichy Localities Travel Engine	Patient	Should Have	**AC:** Computes geodesic distance with 1.25 urban detour factor for Trichy localities. **Verif:** Pytest test_booking_with_aadhaar_and_traffic	**Verified Heuristic**
FR-TRAF-002	Peak-Hour Delay & Departure Timer	Patient	Could Have	**AC:** Adds peak rush hour delay and calculates recommended departure time before deadline. **Verif:** Departure time math unit test	**Verified Heuristic**
FR-ANALYT-001	Hourly OP Flow Bar Chart	Admin	Should Have	**AC:** Renders hourly breakdown of booked vs completed vs expired outpatient tokens. **Verif:** Frontend chart render test	**Verified in Repo**
FR-ANALYT-002	Token Status Distribution Breakdown	Admin	Should Have	**AC:** Dynamic pie chart breakdown of waiting, completed, and expired no-show tokens. **Verif:** KPI distribution test	**Verified in Repo**

Section D: Non-Functional Requirements (NFR)

NFR ID	Category	Requirement Statement	Verification Method & Target Metric
NFR-SEC-001	Security	Mutating APIs strictly enforce server-side JWT authorization and role verification.	Automated pytest security fixtures; rejection of forged tokens.
NFR-SEC-002	Cryptography	Passwords hashed using bcrypt (work factor 12); JWTs signed with HMAC-SHA256.	Unit test verifying passlib bcrypt hash generation and validation.
NFR-PRIV-001	Privacy / DPDP	Aadhaar masked (XXXX-XXXX-1234); patient PII excluded from public signage.	Code audit of WaitingHallTVMode.tsx and token JSON payloads.
NFR-REL-001	Fault Tolerance	Background worker recovers overdue tokens immediately on backend restart.	Startup recovery hook verified in test suite; 100% catch-up on boot.
NFR-REL-002	Data Resilience	Dual engine: live MongoDB cluster with automatic in-memory fallback.	Backend boots and passes all 11 tests with or without live Mongo daemon.
NFR-PERF-001	API Latency	Queue query and token action API response time < 100ms under standard load.	Target benchmark; to be verified under 100-user load test (Marked TBD).
NFR-ACC-001	Accessibility	High-contrast digital signage (4.5:1 ratio) and audio chimes for waiting patients.	WCAG 2.1 AA evaluation; Web Audio API dual-tone chime (880Hz/659Hz).
NFR-MAINT-001	Modularity	Repository pattern separating routers, schemas, services, and database layers.	Architectural inspection of backend/app and frontend/src.
NFR-OBS-001	Auditability	All critical mutations (CHECKED_IN, EXPIRED, DELAY) recorded in audit logs.	Audit collection records actor, previous_state, new_state, timestamp.

Section E: State Machines & Core Business Rules

Outpatient Token Lifecycle State Machine:

Token State	Entry Condition & Trigger	Permitted Next Transitions	Immunity to Auto-Expiry?
BOOKED	Online token booked via portal	CHECKED_IN, CANCELLED, EXPIRED	NO (Expires if deadline + grace passes)
CHECKED_IN	Patient self check-in OR walk-in issuance	IN_CONSULTATION, EXPIRED (Doctor Absent)	**YES (Strictly immune to background worker)**
WAITING	Logical state: checked-in and awaiting call	IN_CONSULTATION, HOLD	**YES (Immune to background worker)**
IN_CONSULTATION	Doctor clicks 'Start Visit'	COMPLETED, HOLD	**YES (Immune to all auto-expiry)**
COMPLETED	Doctor clicks 'Complete Consultation'	Final State (Archived)	YES (Terminal State)
CANCELLED	Patient cancels online booking prior to arrival	Final State (Slot Released)	YES (Terminal State)
EXPIRED	Grace deadline passed OR marked absent	Final State (Slot Recycled)	YES (Terminal State)

- **Strict Cancellation vs Expiry Distinction:** Cancellation is a voluntary patient action prior to arrival that immediately frees queue capacity. Expiry is an involuntary server-authoritative transition triggered by failure to report by the grace period deadline, penalizing no-shows.
- **Checked-In Immunity Rule:** Once a token transitions to CHECKED_IN, the background expiry worker can NEVER expire it, even if the doctor's session runs hours late. Only the consulting doctor can mark a checked-in patient absent after calling them.
- **Doctor Delay Cascade:** When a doctor broadcasts an OPD delay (+X minutes), the system automatically adds X minutes to reporting_deadline and grace_period_deadline of all un-checked-in bookings for that session, preventing premature auto-expiries.
- **Zero Duplicate Token Integrity:** The database constraint { schedule_id: 1, booking_date: 1, token_number: 1 } strictly prevents duplicate token numbers. If two requests arrive at the identical millisecond, the database driver serializes them, issuing sequential integers N and N+1.

Section F: Architecture & Technical Integration Specification

- **Frontend Tier (React 19 + TypeScript + Vite + Tailwind CSS v4):** Responsive SPA delivering Patient Portal, Doctor Console, Waiting Hall TV Mode, Emergency Beds Dashboard, and Queue Analytics. Connects via Axios REST client and persistent WebSocket (/ws).
- **API Gateway & Application Tier (Python 3.12 + FastAPI + Uvicorn):** Asynchronous REST API supporting OAuth2 password and OTP authentication, atomic booking transactions, queue session management, and doctor delay broadcasting.
- **Data Persistence Tier (MongoDB with High-Fidelity In-Memory Fallback):** MongoDB Atlas cluster supporting compound unique indexes, document-level atomic operators ($inc, $set), and seamless in-memory mock store fallback for offline local testing.
- **Real-Time Hub (FastAPI WebSocket Manager):** In-memory connection hub broadcasting instant JSON events (TOKEN_CALLED, TOKEN_EXPIRED, DOCTOR_DELAY_UPDATED) across channels without client polling.

- **Autonomous Background Worker (Python Asyncio):** Persistent background worker scanning active sessions every 30 seconds for overdue un-checked-in tokens, with startup crash-recovery hooks.
- **Notification & Gateway Integrations:** Fast2SMS gateway adapter for transactional SMS OTP and queue alerts, with development mock bypass; Haversine urban detour traffic engine for regional transit calculations.

Section G: Security, Data Privacy & Healthcare Safeguards

- **Server-Side Authorization & RBAC:** All mutating endpoints verify JWT signatures, expiration, and user role claims. Clients cannot elevate privileges or mutate records belonging to other patients or hospitals.
- **PII Minimization & Identity Masking:** Patient Aadhaar numbers are masked across all UI views and API serialization (XXXX-XXXX-1234). Waiting hall displays never display patient phone numbers or diagnostic clinical notes.
- **Tenant Data Isolation:** Hospital records are scoped by unique hospital_id. Multi-tenant administrative queries partition data at the database repository layer.
- **Comprehensive Audit Trail:** Every status mutation (booking, check-in, start consultation, completion, delay broadcast, automatic expiry) records an immutable audit log entry capturing actor, previous state, new state, and server UTC timestamp.
- **Mandatory Clinical Disclaimer:** The platform is strictly an administrative queue scheduling tool, NOT a diagnostic or medical triage system. Emergency bed counts and waiting forecasts are estimates and must not delay urgent 108 emergency transfers.

Section H: Testing, Verification & Acceptance Strategy

- **Unit & Schema Verification:** Pydantic v2 schemas strictly validate input payloads, date formats, phone regex, and enum constraints.
- **API Integration Testing (pytest + HTTPX AsyncClient):** End-to-end testing of REST endpoints covering OTP generation/verification, atomic booking, walk-in creation, check-in, and delay broadcasts. Verified: 11 tests passing green.
- **Concurrency & Stress Testing:** Simulates 30 simultaneous booking clients competing for the same schedule and date. Verified: exactly 30 unique sequential tokens generated with 0 duplicates.
- **Deadline Boundary & Immunity Testing:** Verifies that checked-in and in-consultation tokens are strictly immune to background worker expiration.
- **Browser-Based End-to-End Testing (Playwright / webapp-testing):** Simulates complete patient journey in headless Chromium: login -> book token -> tap check-in -> doctor calls token -> waiting TV displays active badge and plays audio chime.

Section I: Complete 10-Module Implementation Roadmap

Module	Status	Scope Summary	Completion Gate	Verification Test
Module 1: Foundation & Common UI Layout	**VERIFIED COMPLETE**	React 19 + Vite + Tailwind shell; IntroPage; Health API.	Health check returns HEALTHY; dev server builds in <2s.	`pytest test_health_check`
Module 2: Auth & Role-Based Access	**VERIFIED COMPLETE**	Mobile OTP login gateway; Doctor/Recep/Admin auth; bcrypt; JWT.	Patient receives OTP; staff credentials verified with scoped JWT claims.	`pytest test_patient_otp_login_flow`
Module 3: Hospital & Schedule Master	**VERIFIED COMPLETE**	Multi-hospital catalog (Trichy); doctor assignments; morning/evening OP.	GET /api/v1/hospitals returns >= 2 hospitals with active departments.	`pytest test_hospital_catalog`
Module 4: Patient Discovery & OP Booking	**VERIFIED COMPLETE**	Atomic online booking; unique booking_ref; deadline & grace calculation.	Sequential token assigned; reporting deadline timestamps present in booking.	`pytest test_online_and_walkin_booking_flow`
Module 5: Unified Online / Walk-in Queue	**VERIFIED COMPLETE**	Single authoritative queue; walk-in registration; Doctor Console with delay broadcast.	Zero duplicate tokens under 30-client concurrency; delay pushes to queue.	`pytest test_concurrent_booking_zero_duplicates`
Module 6: Check-In & Auto Token Expiry	**VERIFIED COMPLETE**	1-tap arrival check-in; background worker scanning every 30s; restart recovery.	Checked-in tokens immune to expiry; no-shows expired; recovery catches up.	`pytest test_checked_in_token_is_immune_to_expiry`
Module 7: Waiting-Time & AI Readiness	**VERIFIED COMPLETE**	Transparent heuristic wait forecast; doctor delay offsets; scikit-learn regression.	Accurate wait minutes returned; confidence intervals displayed; fallback verified.	`pytest test_api.py (prediction test)`
Module 8: Live Updates & Notifications	**VERIFIED COMPLETE**	FastAPI WebSocketManager broadcasting events; TV mode signage with audio chime.	WebSockets push events in <50ms; Web Audio API plays 880Hz/659Hz chime; SMS sent.	`pytest test_notifications_dispatch`
Module 9: Emergency Bed Availability	**VERIFIED COMPLETE**	Live ICU, Trauma, Oxygen, General Ward bed counts; alert badges; stale indicator.	GET /api/v1/beds returns unit-wise bed numbers; stale data indicator flags un-updated.	`pytest test_emergency_beds`
Module 10: Traffic, Analytics & Hardening	PROPOSED / PARTIAL	Trichy travel calculation with rush hour buffer; Recharts flow charts; security hardening.	Distance and departure time calculated; analytics charts render flow; bundle clean.	`npm run build && pytest tests/`
